RFID Quick Recap
RFID Components

Local/Network Edge

Remote/Data Centre

Tasks in sequence

- Collect Sensor Data
  - RFID Readers, RFID Label Printers, Temp. Sensors, Laser Diodes, etc
- Cleanse and Normalize Sensor Data
  - Cleanse, Normalize, Filter observations
  - Only "Relevant" events are forwarded
- Dispatch Sensor Data
  - Deliver Sensor Data to various distribution systems
- Device Management
  - Manage and Monitor Sensors and Response Devices
  - Sensors, Light Stacks, Message Boards, Carousels, etc
- Process Instructions
  - Local Processing
  - Send instructions to Display/Notification Devices

RFID System
In typical RFID processing systems there is a need to:

- **Reduce** the volume of RFID data that comes directly from RFID readers (and other data sources). Specifically
  - accumulate data over specified time intervals
  - filter data to eliminate duplicate IDs and IDs that are not of interest
  - count and group IDs to reduce volume

- **Enhance** application portability and interoperability by decoupling applications from the physical layers of infrastructure through an API

- **Report** in various forms
Application Level Events

- ALE Middleware Engine processes RFID data coming from readers
- ALE API provides facilities to specify, in a high-level, declarative way, what RFID data they are interested in
  - does not dictate an implementation
  - SOAP bindings map abstract API to Web service implementation
  - does not specify how ALE interfaces with data sources or triggers
- Formal processing model around clients’ event cycle specifications

ALE Terminology

- Reader
  - source of raw RFID observations
  - RFID reader, EPC enabled bar code reader, person typing EPC data
- Read Cycle
  - smallest unit of interaction with a reader
- Logical reader
  - abstract source of EPC data
  - often synonymous with location

ALE Terminology (cont.)

- Event Cycle
  - smallest unit of interaction between client and ALE
  - may consist of one or multiple read cycles
  - event cycles are defined by their boundaries
- Event Cycle Boundaries
  - may extend for a specified interval of time e.g. accumulate reads into five-second intervals
  - may occur periodically e.g. report every 30 minutes regardless of the read cycle
  - may be triggered by external events e.g. an event cycle starts when a pallet on a conveyor triggers an electric eye upstream of a portal, and ends when it crosses a second electric eye downstream of a portal
  - may be delimited when no new IDs are detected by any Reader specified for that event cycle for a specified interval of time
- Report
  - data about a specified event cycle communicated to a client
ALE Cycle Example

Source: The Application Level Events (ALE) Specification, Version 1.0

ALE Core API - Part 1

- define(specName:string, spec:ECSpec) : void
  - Define ECSpec to the ALE Engine
- undefine(specName:string) : void
  - Undefine specified ECSpec
- getECSpec(specName:string) : ECSpec
  - Get ECSpec from engine
- getECSpecNames() : List
  - Get names of ECSpecs known by the engine;
- subscribe(specName:string, notificationURI:string) : void
  - Subscribe to an ECSpec with a certain notification URI string
- unsubscribe(specName:string, notificationURI:string) : void
  - Remove subscription to ECSpec defined with notification URI

ALE Core API - Part 2

- poll(specName:string) : ECReports
  - Poll the ECSpec for reports
- immediate(spec:ECSpec) : ECReports
  - Define the spec, poll it and undefine it
- getSubscribers(specName:String) : List
  - Who is currently subscribed to this ECSpec
- getStandardVersion() : string
  - ALE Standard level supported by this engine
- getVendorVersion() : string
  - ALE Engine version number
Event Cycle Specification

- Event Cycle Specification ECSpec
- readers : List
  - A logical reader i.e. any tag source (one or more readers with one or more antennas, also an EPC-enabled bar code reader)
  - For example a location (e.g. a dock door) where read events are captured for all physical readers attached to a location or one specific reader defined for a location
- boundaries : ECBoundarySpec
  - Defines a filter and the scope of an event specification
    - It defines the when and how the filter should start and stop and what the filter is
- reportSpecs : List
  - Defines the contents and the format of a report
- includeSpecInReports : boolean
  - Include ECSpec in report that is returns

Event Cycle Boundary

- Event Cycle Boundary Spec defines the beginning and the end of an event cycle
- An event cycle starts if one of the following conditions occurs:
  - The specified start trigger is received while an ECSpec is in the Requested state.
  - The repeat period has elapsed from the start of the last event cycle and the ECSpec is still in the Requested state.
- An event cycle ends when one of the following conditions is met:
  - The time interval specified in the duration field expires.
  - The stop trigger is received.
  - The ECSpec transitions to the Defined but Unrequested state.

Event Cycle Boundary (cont.)

- ECTrigger is a URI that denotes the beginning or end of EC
  - Interpretation of this URI is left to the implementation
    - e.g. a motion sensor fires
- ECTerminationCondition specifies how the EC should end
  - TRIGGER: An explicit stop trigger is received.
  - DURATION: Duration expires.
  - STABLE_SET: EPCs under observation have been stable for a duration.
  - UNREQUEST: there are no requesting/subscribed clients.
Filtering and Grouping

- Processing of observations for inclusion into report (ECReportSpec)
  - Filtering is used to identify specific patterns in the event data (ECFilterSpec)
  - Grouping is used to aggregate data collected from different Readers over multiple event cycles (ECGroupSpec)

Filtering and grouping examples

- Filtering has include and exclude patterns

- Grouping has a single pattern list over which the aggregation is carried
  - group together all observations: urn:epc:pat:gid-96:*.*.*.*
  - group observations by item type: urn:epc:pat:gid-96:*.*.X.*
  - group per company observations with serial number in range 1-100: urn:epc:pat:gid-96:*.*.*.[1-100]

subscription based example

ALE Client Application Does the following

1. Creates an event cycle specification
   - Data sources
     - Logical readers: dockdoor?
   - Data aggregation
     - Collection period: duration 5 seconds
     - Selection criteria
       - Exclude filters: exclude case tags
   - Report format (two reports requested)
     - Report 1: Current (tags seen in this cycle)
     - Report 2: Additions (tags seen in this cycle, but not in previous cycle)
     - Provide a list of EPC Tag URIs

2. Defines (sends) the event cycle specification to an ALE Engine

3. Subscribes to the event cycle specification at the ALE Engine
Example of tag processing by ALE Engine
(subscription case)

Getting EPC data from ALE Engine (query based example):

1. Creates an event cycle specification
   - Data sources
     - Logical readers: dockdoor1
   - Data aggregation
     - Collection period: duration 5 seconds
     - Selection criteria
       - Include filters: include pallet tags
   - Report format (two reports requested)
     - Report 1: Current (tags seen in this cycle)
     - Report 2: Additions (tags seen in this cycle, but not in previous cycle)
     - Provide a list of EPC Tag URIs
2. Sends an Immediate request to the ALE Engine
3. Receives event cycle report in response
Recap: EPCglobal NRFID architecture

<table>
<thead>

</table>

ONS Recap

Solaris 10 nslookup
Set DNS record type to NAPTR
ONS reply

Try test ONS server at epc.dcs.bbk.ac.uk

Simple EPC Query with XML RPC

```
<methodCall>
  <methodName>LockstepEPDS.getEPCItemCurrentLocation/</methodName>
  <params>
    <param name="itemId">1234</param>
    <param name="options">epc:id option:80023.456.879:0</param>
  </params>
</methodCall>
```

- EPC DS interfaces in flux
- Open source implementation of a possible solution with XML RPC
- Based on the eXist native XML engine and query XQuery processor available via exist.sourceforge.net
Delegation

- Domain sgtin.id.onsepc.com controlled by EPCglobal
- Delegation at the EPC Manager layer
  - e.g. domain 0614141.sgtin.id.onsepc.com is delegated to EPC Manager 0614141
- List of EPC managers’ EAN.UCC codes (used in bar codes) maintained on ONS
  - wget http://www.onsepc.com/ManagerTranslation.xml

EPC Discovery Service

- ONS is authoritative at production
  - i.e. ONS points to the originator/manufacturer of the object but not subsequent custodians of the EPC (serial) code
  - even more complex if objects are transferred from consumer to consumer
- EPC observation responsibility moves from one custodian to next
  - e.g. from manufacturer, to wholesaler, to retailer
- ONS queries cannot follow through (cf. next slide)
- EPC DS allows track-and-trace applications

ONS and EPC DS

- One approach for tractability is to daisy-chain at the ONS from custodian to custodian
- One broken link destroys the sequence
- Solution: keep pointers to each link in the sequence at the EPC DS
**EPC DS records**

- change of custodian (arrival / departure)
- change of EPC to track
  - upon aggregation into a container
  - upon re-tagging / re-packaging
- whether the particular EPC is marked for recall
- track forwards to the current custodian
  - to get current information about location/status
  - to determine who to contact about a product recall
- trace backwards to find all custodians which
  - have handled the object and may hold some data on it

**EPC Information Service**

- EPC IS: Standard Interface for capture and publication of EPC data (still draft)
- In essence, a distributed database
- Some degree of "semantic" level information
- Provides a common model for location data

**EPC IS records**

- Instance level data:
  - Time-stamped observations
- Class level data
  - Classification schemes
- Queries:
  - Which readers saw tag A?
  - Which tags did reader R see?
  - What happened from time t1 to time t2?
Full SOAP example

```
<soap:Envelope xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/">
  <soap:Header>
    <!-- EPC IS Authentication profile -->
  </soap:Header>
  <soap:Body>
    <!-- Full SOAP envelope shown -->
    <request>
      <!-- Any WS framework can be used as client -->
    </request>
  </soap:Body>
</soap:Envelope>
```

- EPC IS Authentication profile
- Full SOAP envelope shown
- Any WS framework can be used as client
- HTTP GET is also supported for backward compatibility

Observation Profile: Log data

- Clients log observations in batch to the EPC-IS
- Same or different locations allowed
- Same or different observations allowed

```
<LogEntry>
  <log eid="123456" time="2022-01-01 12:00:00" />
</LogEntry>
```

Operation returns status:

```
<status>true</status>
```

Observation Profile: Query

- Query EPC-IS for observations recorded at a specific location

```
<getEventByLocation>
  <location>xyz.example.com/123</location>
</getEventByLocation>
```

Operation returns the full list of observation i.e. exactly the XML on the previous slide

```
<logEntries>
  <logEntry>
    <log eid="123456" time="2022-01-01 12:00:00" />
  </logEntry>
</logEntries>
```
Observation Profile: Other Queries

- `logEvent(logEvents)`
  - Logs multiple observations
- `getEventsByLocation(location)`
  - Retrieves all observations logged at the specified location
- `getEventsByLocationByTimeRange(location, fromTime, toTime)`
  - Retrieves all observations logged at the specified location between two times
- `getEventsByTimeRange(fromTime, toTime)`
  - Retrieves all observations logged between two times
- `getEventsByEPC(epc)`
  - Retrieves all observations of the specified EPC
- `getEventsByEPCByTimeRange(epc, fromTime, toTime)`
  - Retrieves all observations of the specified EPC between two times
- `deleteEventsByLocationByTimeRange(location, fromTime, toTime)`
  - Deletes all observations made at a location between two times
- `deleteEventsByEPCByTimeRange(epc, fromTime, toTime)`
  - Deletes all observations of an EPC made between two times

Containment Profile

- Aggregation into larger units
- The aggregation hierarchy is defined implicitly by specifying the items included in a container
- Both container and contents are specified using their respective EPC codes

Containment Profile: Example

- Containment relationships are time sensitive i.e. they start at a specific time and have a specific end
- Relationships do not exist outside their defined time frames
- Thus, each method in the profile requires a time parameter
Containment Profile: Example

- How to find the container of a particular object
  
  \[
  \begin{align*}
  \text{getContainer} & : \text{urn:epc:id:app1:00100 432 507} / \text{app1} \\
  \text{getContainer} & : \text{urn:epc:id:app1:00100 432 507} / \text{app1} \\
  \text{getContainer} & : \text{urn:epc:id:app1:00100 432 507} / \text{app1} \\
  \end{align*}
  \]

- If there is such a container, then
  
  \[
  \begin{align*}
  \text{getContainer} & : \text{urn:epc:id:app1:00100 138 109} / \text{app1} \\
  \text{getContainer} & : \text{urn:epc:id:app1:00100 138 109} / \text{app1} \\
  \text{getContainer} & : \text{urn:epc:id:app1:00100 138 109} / \text{app1} \\
  \end{align*}
  \]

- If there is not, then an error message
  
  \[
  \begin{align*}
  \text{getContainer} & : \text{urn:epc:id:app1:00100 432 507} / \text{app1} \\
  \text{getContainer} & : \text{urn:epc:id:app1:00100 432 507} / \text{app1} \\
  \text{getContainer} & : \text{urn:epc:id:app1:00100 432 507} / \text{app1} \\
  \end{align*}
  \]

EPC IS Static Attribute Profile

- Ask for specific attributes of an object
  
  - XPath query
    
    \[
    \begin{align*}
    \text{getStaticAttribute} & : \text{urn:epc:is:082333 321 123} / \text{app1} \\
    \text{getStaticAttribute} & : \text{urn:epc:is:082333 321 123} / \text{app1} \\
    \text{getStaticAttribute} & : \text{urn:epc:is:082333 321 123} / \text{app1} \\
    \end{align*}
    \]

- Returns the requested data
  
    \[
    \begin{align*}
    \text{getAttributeName} & : \text{urn:epc:is:082333 321 123} / \text{app1} \\
    \text{getAttributeName} & : \text{urn:epc:is:082333 321 123} / \text{app1} \\
    \text{getAttributeName} & : \text{urn:epc:is:082333 321 123} / \text{app1} \\
    \end{align*}
    \]

- And then change it
  
    \[
    \begin{align*}
    \text{setAttributeValue} & : \text{urn:epc:is:082333 321 123} / \text{app1} \\
    \text{setAttributeValue} & : \text{urn:epc:is:082333 321 123} / \text{app1} \\
    \text{setAttributeValue} & : \text{urn:epc:is:082333 321 123} / \text{app1} \\
    \end{align*}
    \]
